MACHINE LEARNING DEPARTMENT

Deep architectures

Definition: Deep architectures are composed of *multiple levels* of non-linear operations, such as neural nets with many hidden layers.

Goal of Deep architectures

Goal: Deep learning methods aim at

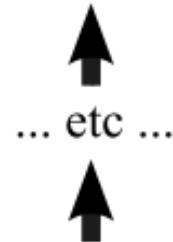

- learning *feature hierarchies*
- where features from higher levels of the hierarchy are formed by lower level features.

edges, local shapes, object parts

Low level representation

very high level representation:

MAN SITTING ...

slightly higher level representation

raw input vector representation:

$$\mathcal{X} = \boxed{23} \boxed{19} \boxed{20} \dots \boxed{18}$$

$x_1 \quad x_2 \quad x_3 \quad \dots \quad x_n$

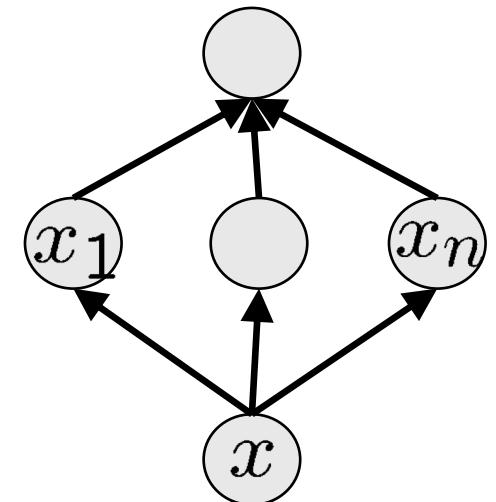

Figure is from Yoshua Bengio

Neurobiological Motivation

- Most current learning algorithms are shallow architectures (1-3 levels) (SVM, kNN, MoG, KDE, Parzen Kernel regression, PCA, Perceptron,...)

$$\text{SVM: } \hat{f}(\mathbf{x}) = \text{sign}\left(\sum_{i=1}^n \alpha_i y_i k(\mathbf{x}_i, \mathbf{x}) \right)$$

- The mammal brain is organized in a deep architecture (Serre, Kreiman, Kouh, Cadieu, Knoblich, & Poggio, 2007)
(E.g. visual system has 5 to 10 levels)

Breakthrough

Deep Belief Networks (DBN)

Hinton, G. E, Osindero, S., and Teh, Y. W. (2006).
A fast learning algorithm for deep belief nets.
Neural Computation, 18:1527-1554.

Autoencoders

Bengio, Y., Lamblin, P., Popovici, P., Larochelle, H. (2007).
Greedy Layer-Wise Training of Deep Networks,
Advances in Neural Information Processing Systems 19

Convolutional neural networks running on GPUs (2012)

Information Processing Systems 2012

Deep Convolutional Networks

Deep Convolutional Networks

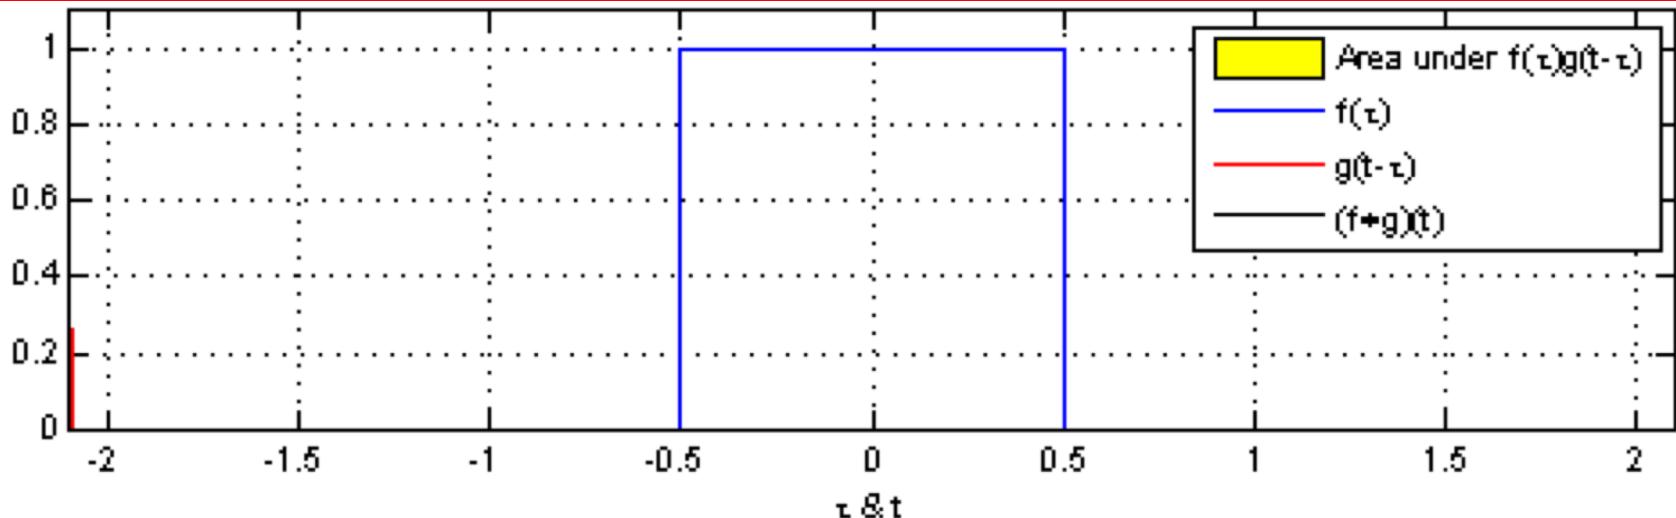

Compared to standard feedforward neural networks with similarly-sized layers,

- CNNs have much fewer connections and parameters
- and so they are easier to train,
- while their theoretically-best performance is likely to be only slightly worse.

LeNet 5

Y. LeCun, L. Bottou, Y. Bengio and P. Haffner: **Gradient-Based Learning Applied to Document Recognition**, *Proceedings of the IEEE*, 86(11):2278-2324, November **1998**

Convolution

Continuous functions:

$$(f * g)(t) = \int_{-\infty}^{\infty} f(\tau) g(t - \tau) d\tau = \int_{-\infty}^{\infty} f(t - \tau) g(\tau) d\tau.$$

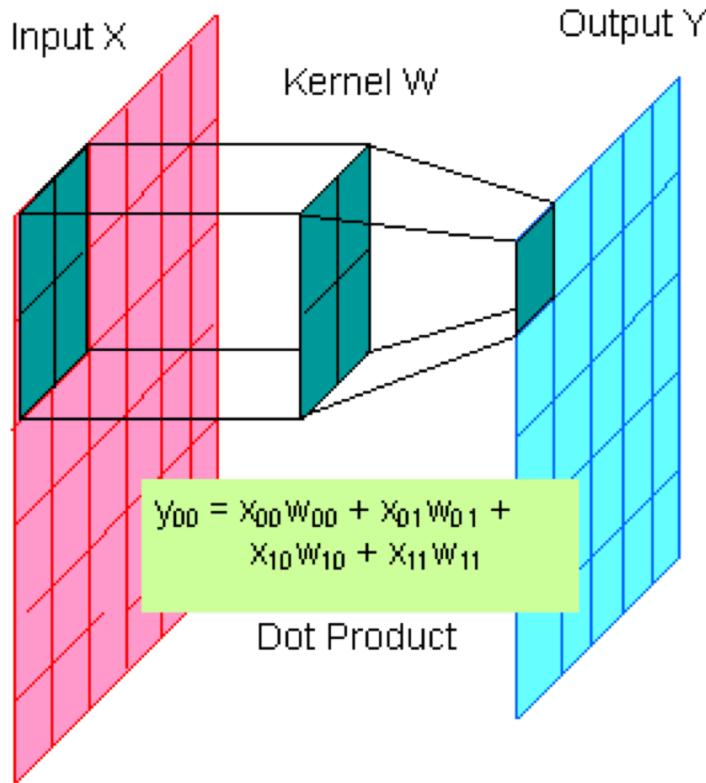

Discrete functions:

$$(f * g)[n] = \sum_{m=-\infty}^{\infty} f[m] g[n - m] = \sum_{m=-\infty}^{\infty} f[n - m] g[m]$$

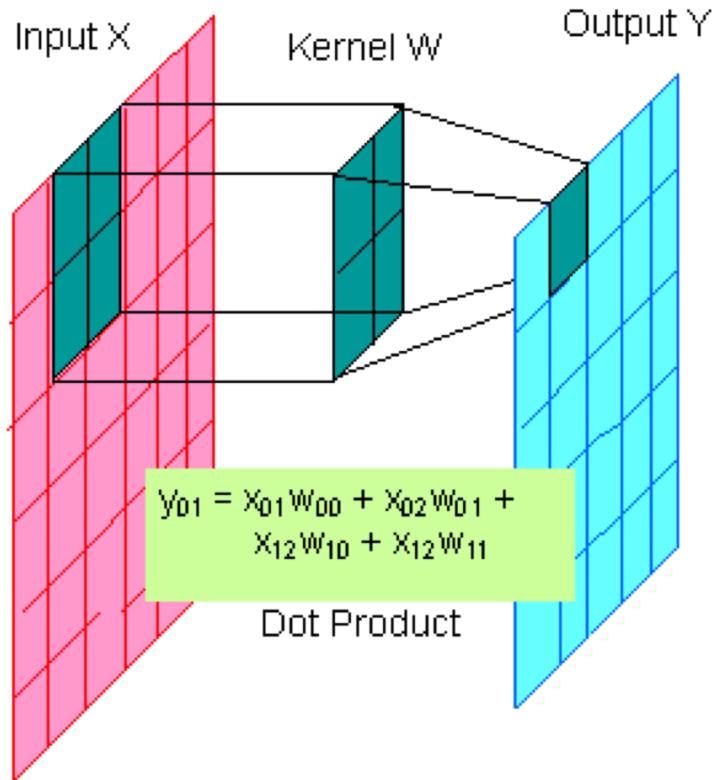

If discrete g has support on $\{-M, \dots, M\}$:

$$(f * g)[n] = \sum_{m=-M}^{M} f[n - m] g[m]$$

2-Dimensional Convolution

2-Dimensional Convolution

2-Dimensional Convolution

$$f[x,y] * g[x,y] = \sum_{n_1=-\infty}^{\infty} \sum_{n_2=-\infty}^{\infty} f[n_1, n_2] \cdot g[x - n_1, y - n_2]$$

LeNet 5, LeCun 1998

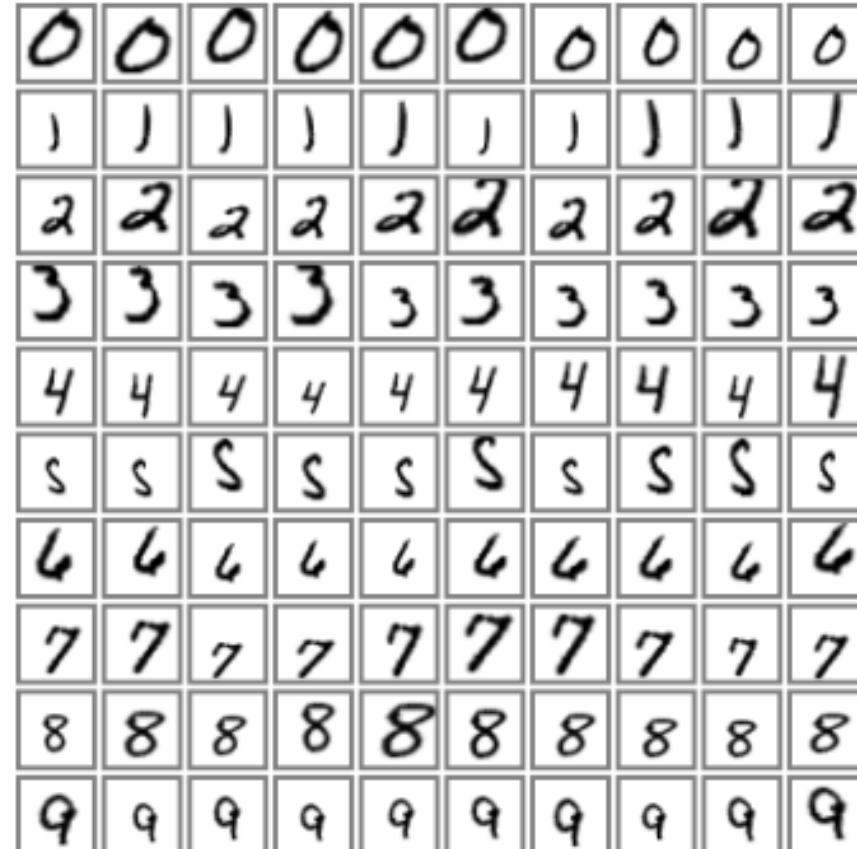

- **Input:** 32×32 pixel image. Largest character is 20×20
(All important info should be in the center of the receptive fields of the highest level feature detectors)
- **Cx:** Convolutional layer (C1, C3, C5) tanh nonlinear units
- **Sx:** Subsample layer (S2, S4)
- **Fx:** Fully connected layer (F6) logistic/sigmoid units
- Black and White pixel values are normalized:
E.g. White = -0.1, Black = 1.175 (Mean of pixels = 0, Std of pixels = 1)

LeNet 5, Noise resistance

The slide illustrates the robustness of LeNet 5 to noise across two types of input data: handwritten digits and street signs.

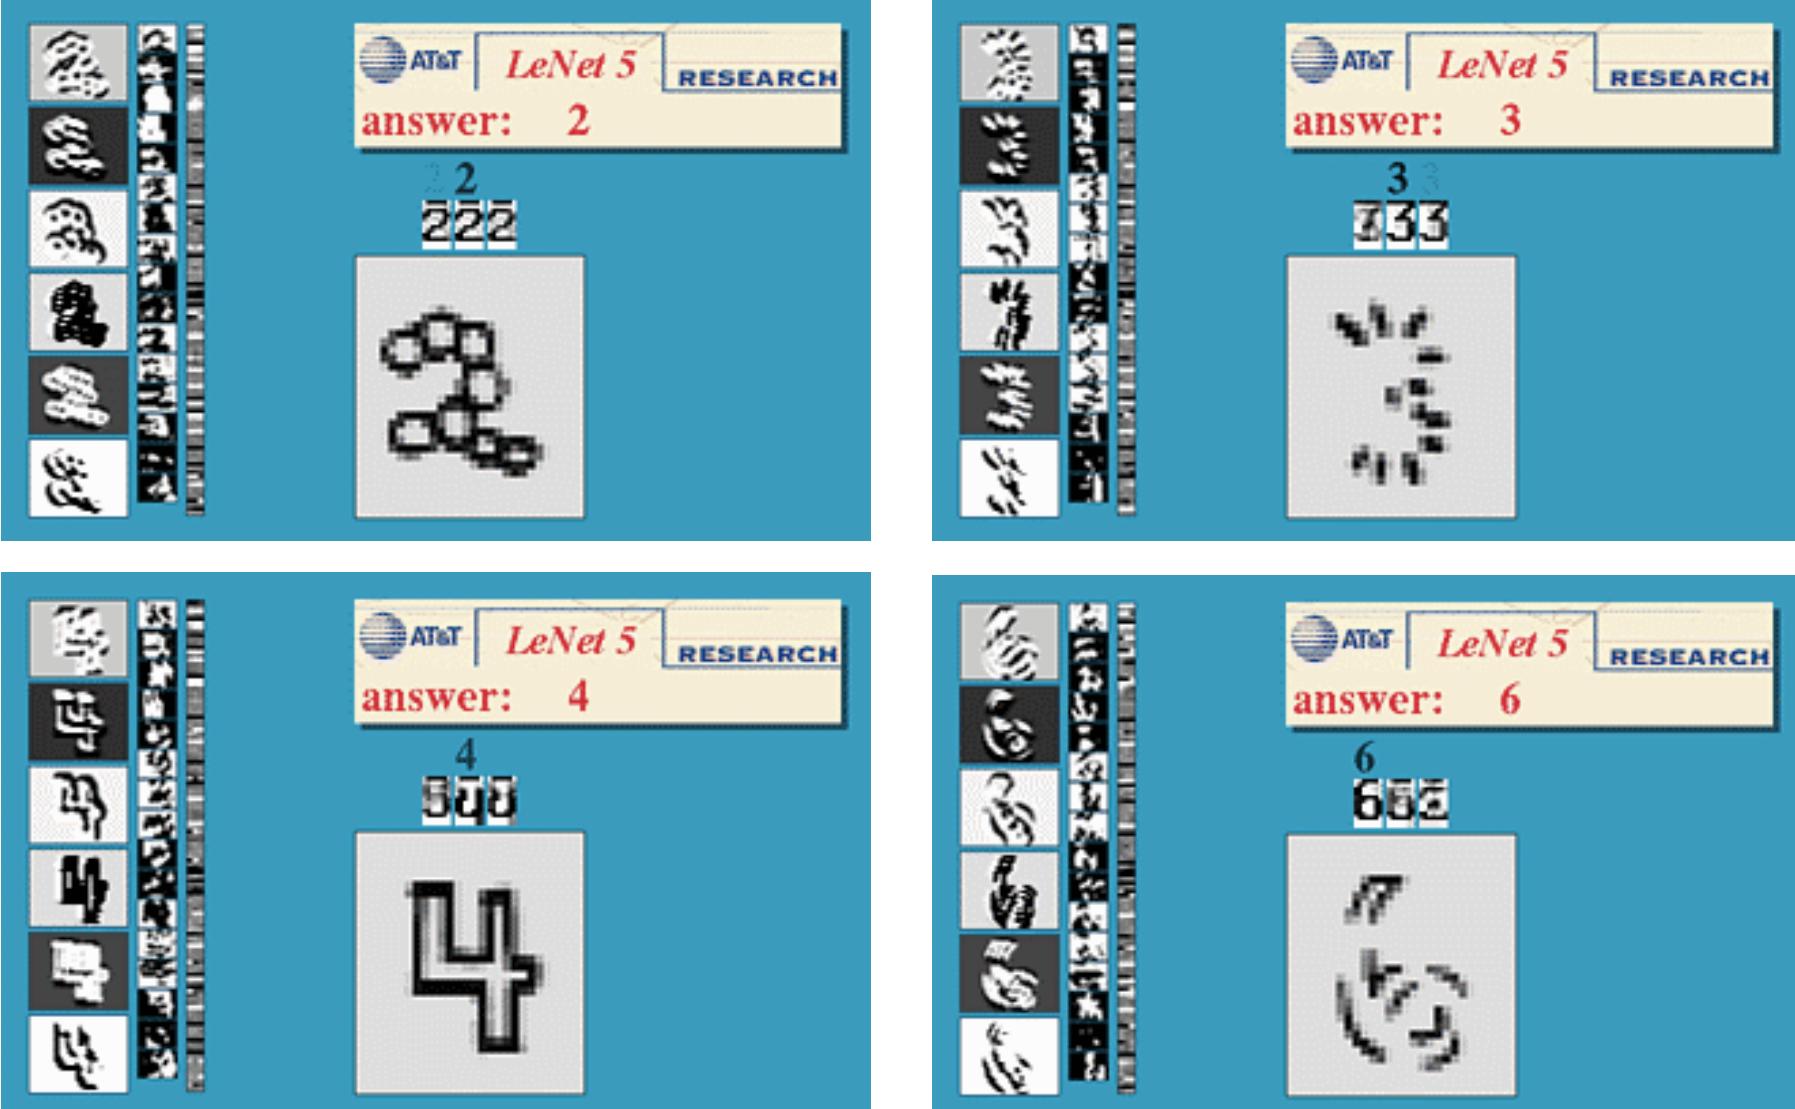

Handwritten Digits:

- Input:** A row of five noisy handwritten digits, each showing a different level of corruption (ranging from clean to heavily noisy).
- Output:** A card labeled "LeNet 5 RESEARCH" showing the digit "6" as the answer. Below it is a clean version of the digit "6".
- Image:** A noisy handwritten digit "6" with significant black speckles and noise.

Street Signs:

- Input:** A row of five noisy street sign images, each showing a different level of corruption (ranging from clean to heavily noisy).
- Output:** A card labeled "LeNet 5 RESEARCH" showing the digit "3" as the answer. Below it is a clean version of the digit "3".
- Image:** A noisy street sign image showing a "30" speed limit sign with significant noise.

ILSVRC

Li Fei-Fei: ImageNet Large Scale Visual Recognition Challenge, 2014 <http://image-net.org/>

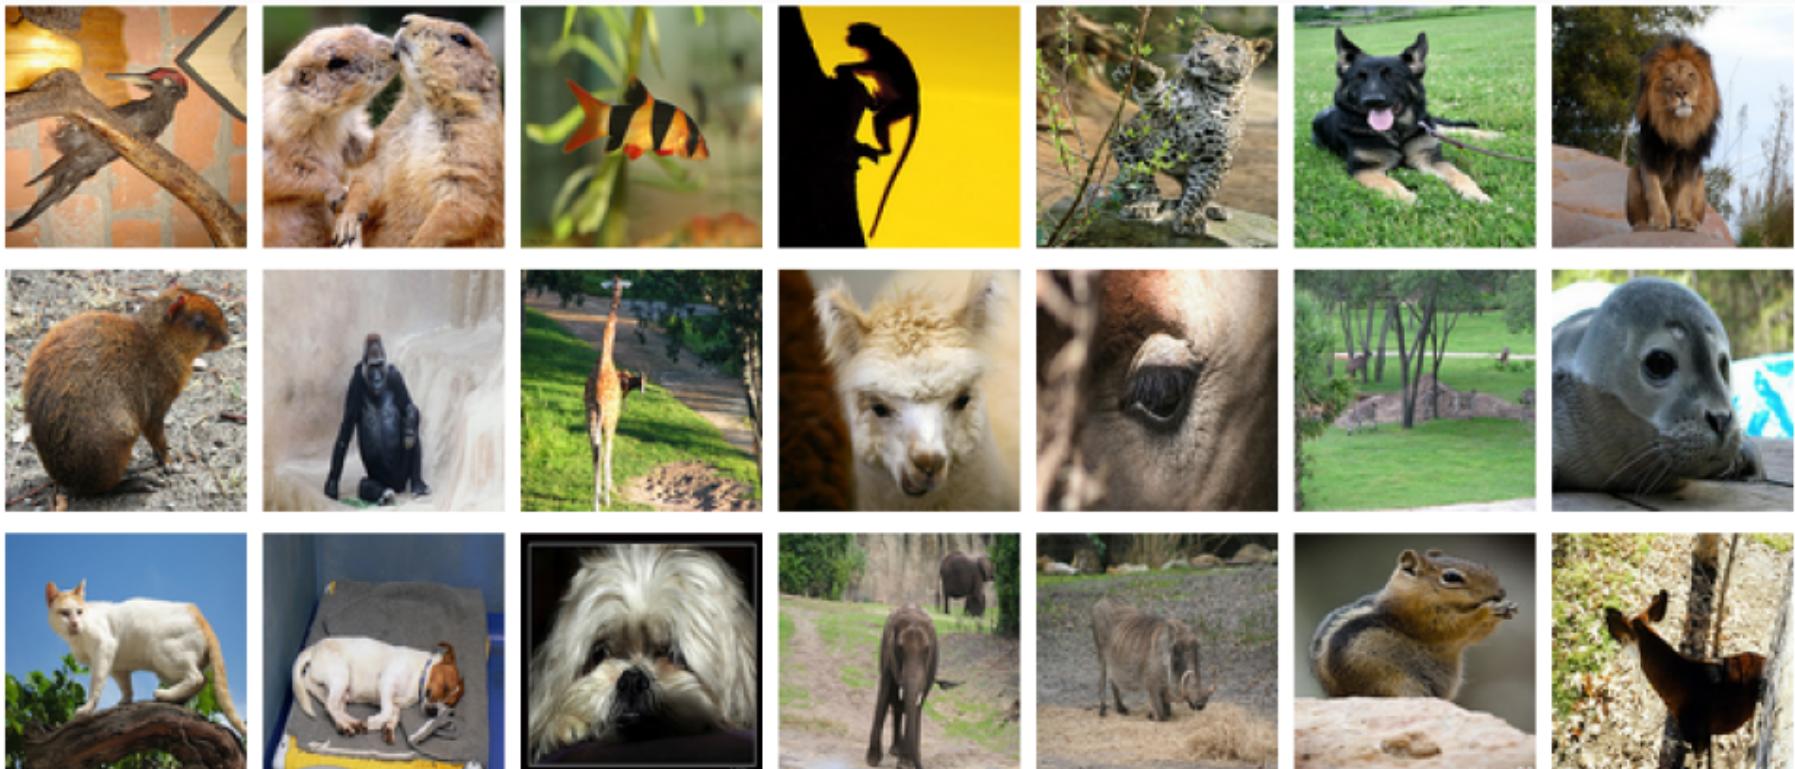

ImageNet

- ❑ 15M images
- ❑ 22K categories
- ❑ Images collected from Web
- ❑ Human labelers (Amazon's Mechanical Turk crowd-sourcing)
- ❑ ImageNet Large Scale Visual Recognition Challenge (ILSVRC-2010)
 - 1K categories
 - 1.2M training images (~1000 per category)
 - 50,000 validation images
 - 150,000 testing images
- ❑ RGB images
- ❑ Variable-resolution, but this architecture scales them to 256x256 size

ImageNet

Classification goals:

- Make 1 guess about the label (Top-1 error)
- make 5 guesses about the label (Top-5 error)

The Architecture

Typical nonlinearities:

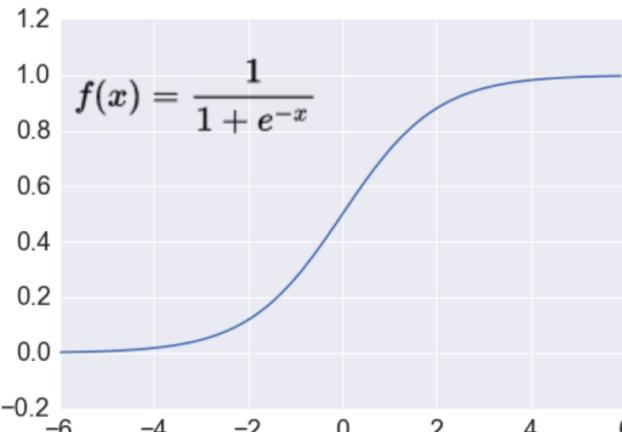

$$f(x) = \tanh(x) = \frac{e^x - e^{-x}}{e^x + e^{-x}}$$

$$f(x) = (1 + e^{-x})^{-1} \quad (\text{logistic function})$$

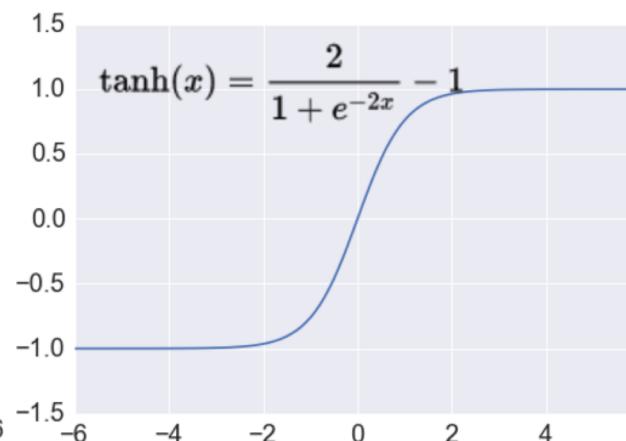

Here, however, Rectified Linear Units (ReLU) are used: $f(x) = \max(0, x)$

Non-saturating/Gradients don't vanish – faster training

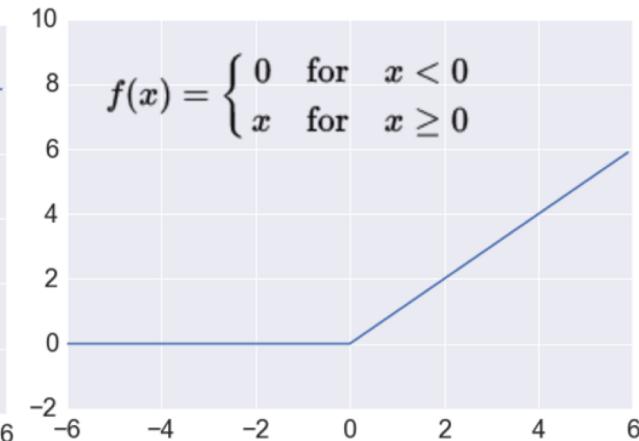

Sigmoid

TanH

ReLU

The Architecture

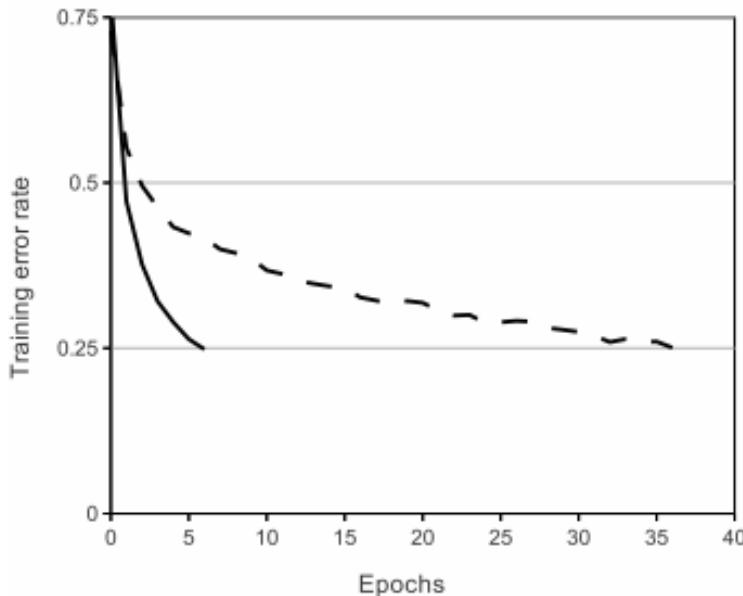

Typical nonlinearities:

$$f(x) = \tanh(x) = \frac{e^x - e^{-x}}{e^x + e^{-x}}$$

$$f(x) = (1 + e^{-x})^{-1} \quad (\text{logistic function})$$

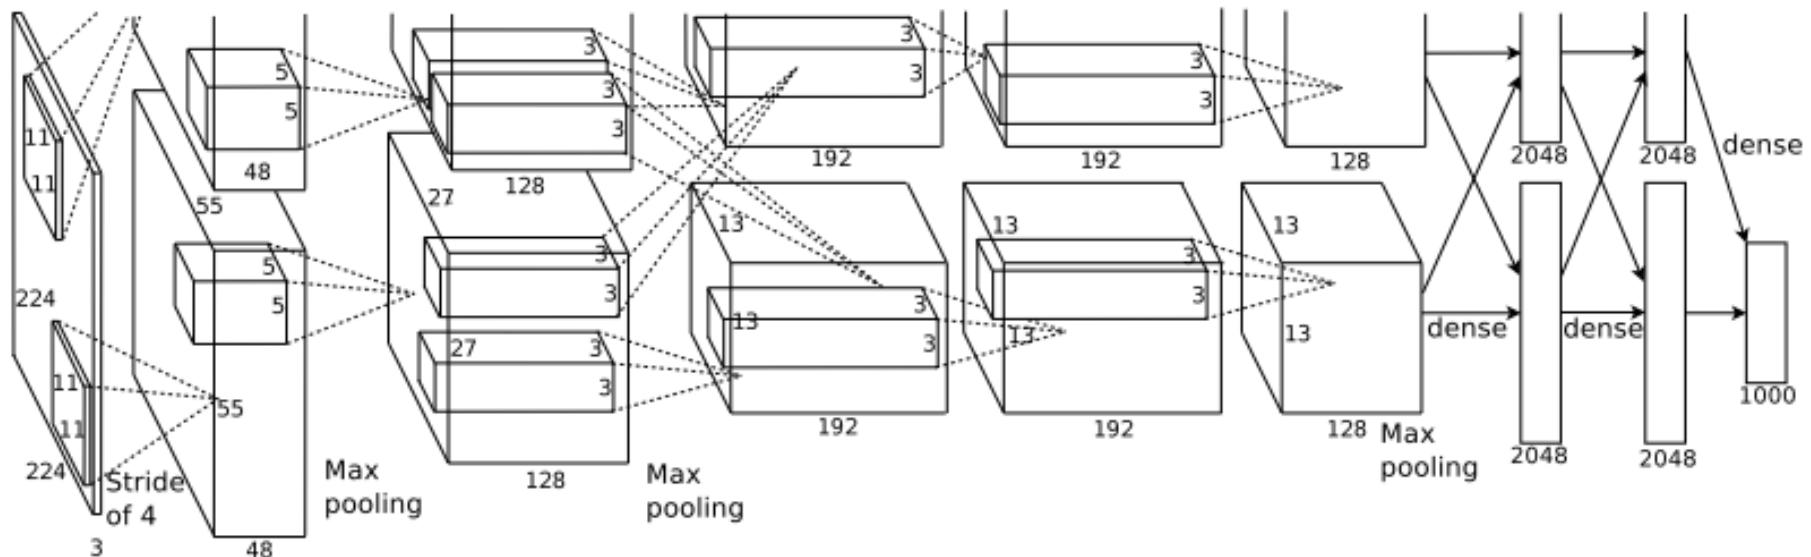

Here, however, Rectified Linear Units (ReLU) are used: $f(x) = \max(0, x)$

Non-saturating/Gradients don't vanish – faster training

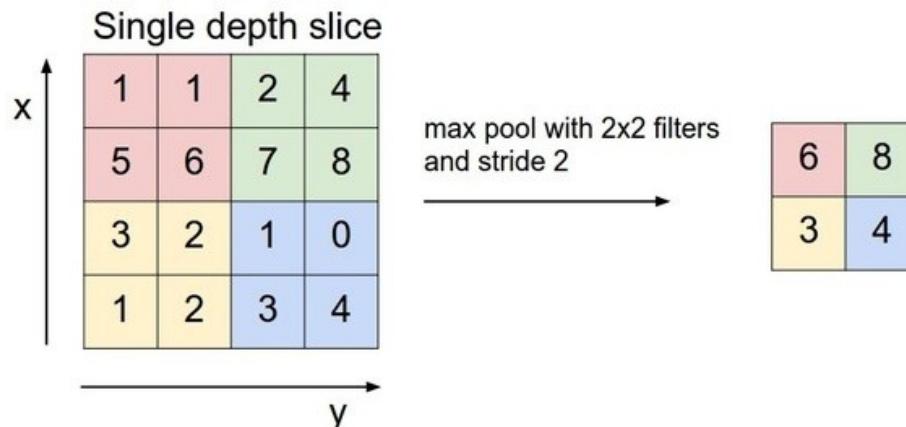

A four-layer convolutional neural network with ReLUs (solid line) reaches a 25% training error rate on CIFAR-10 six times faster than an equivalent network with tanh neurons (dashed line)

The Architecture

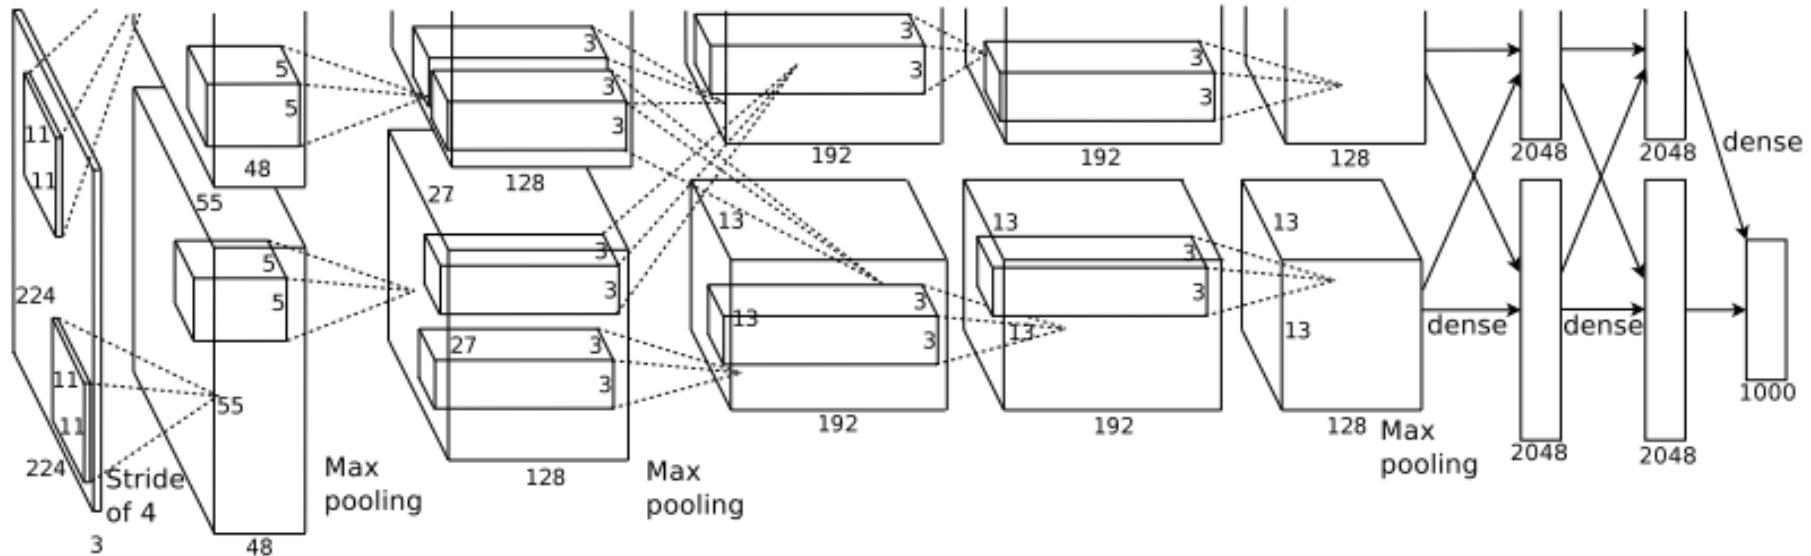

5 convolution layers (ReLU)

3 overlapping max pooling – nonlinear downsampling (max value of regions)

The Architecture

5 convolution layers (ReLU)

3 overlapping max pooling – nonlinear downsampling (max value of regions)

2 fully connected layers

output softmax

The Architecture

- Trained with stochastic gradient descent
 - on two NVIDIA GTX 580 3GB GPUs
 - for about a week
-
- 650,000 neurons
 - 60,000,000 parameters
 - 630,000,000 connections
 - 5 convolutional layer with Rectified Linear Units (ReLUs), 3 overlapping max pooling, 2 fully connected layer
 - Final feature layer: 4096-dimensional
-
- Prevent overfitting – data augmentation, dropout trick
 - Randomly extracted 224x224 patches for more data

Preventing overfitting

1) The easiest and most common method to **reduce overfitting** on image data is to artificially **enlarge the dataset** using label-preserving transformations.

We employ two distinct forms of **data augmentation**:

- image translation
- horizontal reflections
- changing RGB intensities

2) **Dropout**: set the output of each hidden neuron to zero w.p. 0.5.

- So every time an input is presented, the neural network samples a different architecture, but all these architectures share weights.
- This technique reduces complex co-adaptations of neurons, since a neuron cannot rely on the presence of particular other neurons.
- forced to learn more robust features that are useful in conjunction with many different random subsets of the other neurons.

Results

Results on the test data:

top-1 error rate: 37.5%

top-5 error rate: 17.0%

ILSVRC-2012 competition:

15.3% classification error

2nd best team: 26.2% classification error
